Q: RxJS - Call function in subscribe() I have a function in a service that needs to be called in the subscribe() of a component. I thought of doing something like this: `public doSomething(): Observable { return Observable.of(1) } private mySubscription: Subscription; private getData(): void { if (this.mySubscription) { this.mySubscription.unsubscribe(); } this.mySubscription = this.service.doSomething().subscribe(x => { console.log(x); }); }` A: Without seeing your class structure or the service you're calling it from, we can only guess the likely answer. The RxJS idea of subscriptions is to observe the state of an object. The set of operators used to subscribe to observables is only run once, usually in an initializer. They do not receive state updates from the source object. If you call a method on the source observable, that method will return a new observable. If a1d647c40b
