Security experts have long said that passwords don't protect you any better than you would by using your dog's name as a security question. That's because an attacker can still guess your password by trying it with a dictionary word. What is bad about passwords? There are many more reasons why passwords are not the best form of secure identification. Don't fall for the temptation to use a password that is hard for you to remember, or one that is similar to other passwords you use on other websites. Also, try and limit the number of passwords that you use, or at least remember that you have more than one password for different accounts. What is a good password? A complex password has a lot of random characters, uppercase, lowercase and other letters, and numbers. ... [EnggBlog] How to Generate 1M passwords Generating 1M passwords can be a difficult process. RKGenerator With License Code Free

RKGenerator is a free utility with unique features that help create security codes for passwords for your favorite accounts and programs on your Windows-based computer. All it needs is a personal access to a computer. The program can generate security keys based on preset value sets, or user inputs. These include numbers, lowercase and uppercase characters, symbols, or custom characters. You can also choose when the string will start, how many unique passwords the user will be able to create, and set the length of each key. You can even manually edit your generated codes and simply click to generate again. Alternatively, you can export all the keys in the form of TXT files for safe editing later. The application uses the same innovative approach for password generation as in the most popular generation engine like Chef. Just give it a valid username and password, and the program will generate it in its entirety. You can configure many of its settings yourself to customize the output. These include the range of password lengths, codes that will start and end. No matter what you choose, or how unique you want your security keys to be, RKGenerator will come up with an infinite number of them in a flash. You can even search by username to find matching accounts more easily. If you want to confirm if RKGenerator is safe, you can add it to your trusted list and run the program directly from that menu. This should secure you from seeing nasty pop-ups on your computer each time you launch the program. The only problem would be if RKGenerator gets into trouble with your browser. You can, of course, just move the program to another place where it doesn't get access to your personal data.
