In general, Autodesk's AutoCAD and other CAD programs support designing in the context of a three-dimensional (3D) model of an assembly of objects. A 2D drawing is considered a 2D representation of a 3D object. A drawing is a representation that shows how the objects are to be combined to create an assembly. A component can be: A building block An assembly component An assembly A stand-alone object To construct a 3D model, a user defines several geometry components that form the parts of a 3D model. These components include: Curves, lines, and arcs that describe the contour of an object Nurbs, which is used to create freeform surfaces and to create mathematical surfaces (e.g., to define the roof of a building) Surfaces (2D shapes) that define the boundaries of an object Polylines, which are used to show planar surfaces Polygons, which are used to describe complex geometry Bounding volumes Mechanics An outline of an object is usually defined in terms of a mathematical equation to determine the shape of the object. The equation is called a "mechanics" or "movement" equation. In earlier AutoCAD releases, mechanics equations were used for two purposes: To help the user see where and how an object is rotated To help the user edit the object to make it freeform, or nonplanar, or non-orthogonal For example, if you make a circle, and you set the Radius

Autodesk has also produced a number of XML schemas for the exchange of information. There are XML schemas for DWG, DXF, Revit, Sandbox, Design Manager, RSL, and custom data for CAD users. There are also a number of XML schemas for the transfer of information such as company information and business practices. There are a number of Add-ons available, including AutoCAD Printing. Autodesk Exchange Apps is an online software store for add-on products for AutoCAD. The products are grouped by theme and arranged in a catalog. AutoCAD Civil 3D In 2010, Autodesk released AutoCAD Civil 3D, and is replacing its predecessor AutoCAD Civil. Civil 3D was the successor to AutoCAD Civil 2008. Civil 3D is built on a better technical platform than AutoCAD Civil 2008. In addition to features from AutoCAD Civil 2008 such as DWG, DXF and PLT formats, Civil 3D offers many new features, including.KIP,.SKP, and.CRT files; reverse engineering; and other features that facilitate designing such as advanced modeling capabilities. Civil 3D also has many other new and expanded features, including Advanced Interference Detection (AID). AID is the process of capturing and generating lists of invisible

objects in a file based on their geometric relationships. Civil 3D also includes a cloud storage platform called iCad. On August 6, 2011, Autodesk announced the release of Civil 3D 2013. AutoCAD Architecture Autodesk Architecture is a package of add-ons to AutoCAD Civil 3D. It offers many of the features available in civil. The main focus of the package is the building and engineering industries. This includes interior design, civil engineering, architectural design, site design, and landscape. Many of the building industry add-ons come from Autodesk Wacom Technology. The add-ons also integrate with Autodesk Revit Architecture and Autodesk Architectural Desktop to bring those applications into the civil design process. AutoCAD Electrical AutoCAD Electrical is a package of add-ons to AutoCAD Civil 3D. These add-ons include electrical modeling and simulation. It is widely used in the building industry, specifically in the electrical engineering and HVAC industries. In addition to simulation, the add-ons include dimensioning and electrical schematics. af5dca3d97

We look forward to seeing you in the new year! Thank you, The AutoCAD Analyst Team1. Field of the Invention The invention relates to a method and a circuit arrangement for demodulating a carrier signal of a radio telephone signal transmitted from a radio telephone by performing a fast Fourier transform on the received signal. 2. Description of the Prior Art A circuit arrangement for generating a stream of discrete Fourier coefficients is known from German Published Examined Application (DE) 35 01 086. In the arrangement, a carrier signal which is a function of the time and a radio telephone signal are input to a filter, which separates the radio telephone signal from the carrier signal. To this end, the filter includes a first circuit arrangement for detecting the radio telephone signal and a second circuit arrangement for generating the carrier signal. The carrier signal is divided into partial signals having a low frequency and a high frequency, and a signal which corresponds to the spectrum of the partial signals of the carrier signal is added to the radio telephone signal. The carrier signal contains digital information bits transmitted in the form of one bit per carrier frequency. After the carrier signal is divided into partial signals, the difference between the partial signals at the high and low frequency of the carrier signal is detected, and the carrier frequency of the carrier signal is determined from the

detected difference and the partial signals of the low frequency of the carrier signal. To demodulate the received signal, a fast Fourier transform is performed on the received signal in order to transform the received signal into a carrier signal of the original spectrum and in order to obtain the digital information from the carrier signal. The fast Fourier transform of the received signal is done in a digital manner with a circuit
