A quantitative analysis of ovulation and progesterone excretion in pregnant gilts by measurement of plasma enzyme activity. A quantitation method for analyzing ovulation and progesterone excretion in pregnant gilts is described. The method

quantitates progesterone by enzyme immunoassay and ovulation by using a radioimmunoassay to detect the enzyme 3 beta-hydroxysteroid dehydrogenase.

Progesterone concentrations in pregnant gilts were measured at 2-h intervals from the time of estrus until the onset of the next ovulation. Ovulation was always confirmed by demonstrating a biphasic rise in luteinizing hormone or a rapid, transient surge in estradiol. Two weeks after parturition, serial blood samples were taken at 10-min intervals until the onset of the next ovulation. Ovulatory activities were inhibited by estradiol-17 beta (0.1-100 micrograms/kg body weight) and progesterone (0.02-2.0 mg/kg body weight). On the other hand, ovulatory activity was stimulated by human chorionic gonadotropin (HCG; 500-4,000 micrograms/kg) in all pregnant gilts examined. These results suggest that this method may be useful for analyzing gilt ovulation and progesterone excretion, and for establishing a hormone profile by using serial serum samples.

Q: How to print the content of a text file in unicode notation (from python script) using the subprocess module? I am using the subprocess module to call a terminal command that writes a file (document.txt) in Unicode. The problem is that the content is not printed in the right notation (for example, it doesn't seem to be in Pycharm Editor) This is the command I am calling from Python shlex
